

ABSTRACT

A method for carrying out and verifying substitution and/or adjustments of mechanical components in an automatic packaging machine (1) during the size change over, said machine (1) being
5 equipped with a computerized unit (UCC,2,D) for verifying and storing instructions related to the operations necessary to change over the size of the articles being processed. The operations include substitution of specific mechanical components and/or adjustment of the spatial positioning of
10 specific mechanical components. Information elements relevant to the size change over are stored in the unit (UCC,2D) and are recalled and transferred to a palm-size computer (3,E).
